

Spring Day 04 - AOP

A word cloud featuring various terms related to Aspect-Oriented Programming (AOP). The words are arranged in a non-uniform, overlapping manner. The largest word is 'AOP' in the center. Other prominent words include '@Pointcut', '@Aspect', 'Join-Point', 'Advice', 'Weaving', 'Spring-AOP', 'Transactions', and 'Security'. The words are in different colors: purple, brown, pink, dark blue, and olive green.

# AOP Concepts

- AOP is a type of programming that aims to help with separation of cross-cutting concerns to increase modularity; it implies declaring an aspect class that will alter the behavior of base code, by applying advices to specific join points, specified by pointcuts.

# Cross-Cutting concerns

# Problems Solved by AOP

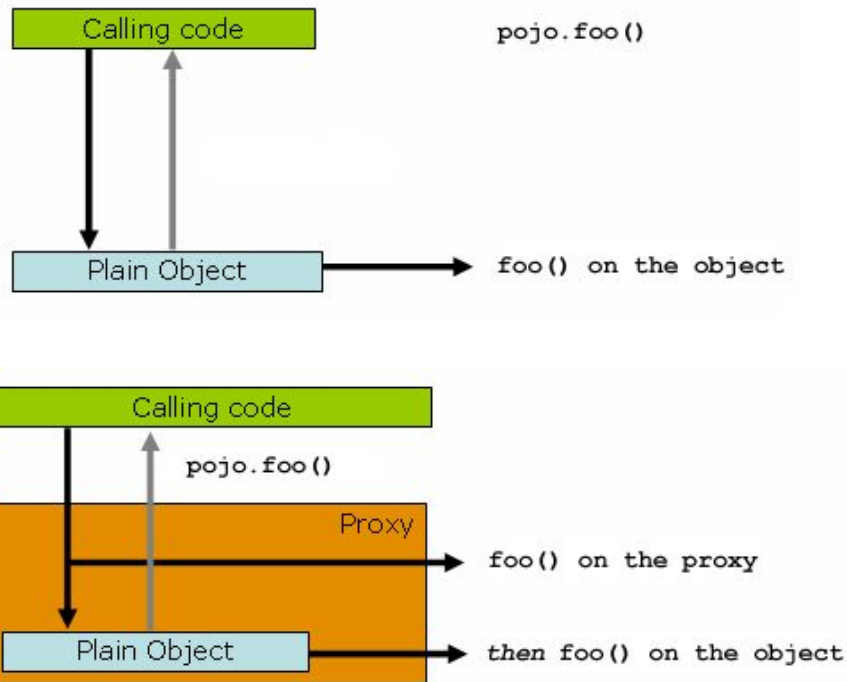

# AOP Terminology

- **Aspect:** a class containing code specific to a cross-cutting concern
- **Join point:** all possible points where an Aspect can be applied
- **Pointcut:** a predicate used to identify join points. Advice definitions are associated with a pointcut expression and the advice will execute on any join point matching the pointcut expression.
- **Advice:** action taken by an aspect at a join point
- **Weaving:** combining advised object with the advice code

# Spring AOP

- Example
- [Spring AOP Documentation](#)

# Spring AOP

# Summary and Best Practices

- Spring AOP advices only public Join Points
- Aspects can be applied only to Spring Beans
- Avoid whenever possible
- Advise only classes that implement an interface
- Advise only methods exposed through an interface
- Call Advised bean only through interface
