Bean Lifecycle

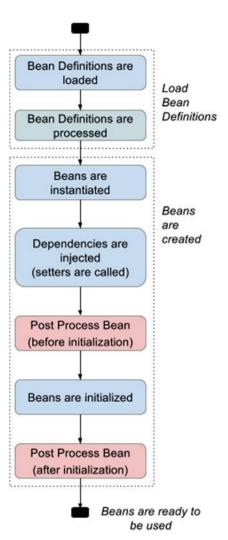

ApplicationContext BeanPostProcessor

Application Context is created Bean Definitions are loaded Load Bean **Definitions** Bean Definitions are processed Beans are instantiated Beans are Dependencies are created injected Beans processed Beans are ready to be used Beans are being used Application stops, Application Context is destroyed

BeanPostProcessors

- The @PostConstruct annotation is part of the JSR 250<u>13</u> and is used on a method that needs to be executed after dependency injection is done to perform initialization. The methods that can be annotated with @PostConstruct must respect the same rules as every other init method: they must have no arguments, return void, and they can have any access right.
- The @PreDestroy annotation is used on methods as a callback notification to signal that the instance is in the process of being removed by the container.
- JSR-250 is a Java Specification Request with the objective to develop annotations (that is, information about a software program that is not part of the program itself) for common semantic concepts in the Java SE and Java EE platforms that apply across a variety of individual technologies.
